

INFORMATION ASSURANCE

Ingenicomm's comprehensive suite of information security and assurance services provides the infrastructure to ensure that mission-critical systems and data are protected from internal and external threats. Ingenicomm's security analysts use the proven CIA Triad model to balance the three key areas of information assurance – confidentiality, integrity and availability – and develop a comprehensive defensive posture to satisfy customer and mission requirements while assuring compliance with government directives and agency policies.

Vulnerability and Risk Assessment

Ingenicomm's information assurance process begins with vulnerability and risk assessment. Using industry-standard tools such as Nessus®, Ingenicomm's security analysts examine the existing security posture of affected systems and networks and develop a plan for remediating or mitigating vulnerabilities and implementing security controls to achieve desired hardening levels or certifications, such as NIST 800 series, FISMA, or CIS standards.

Comprehensive Security Implementation

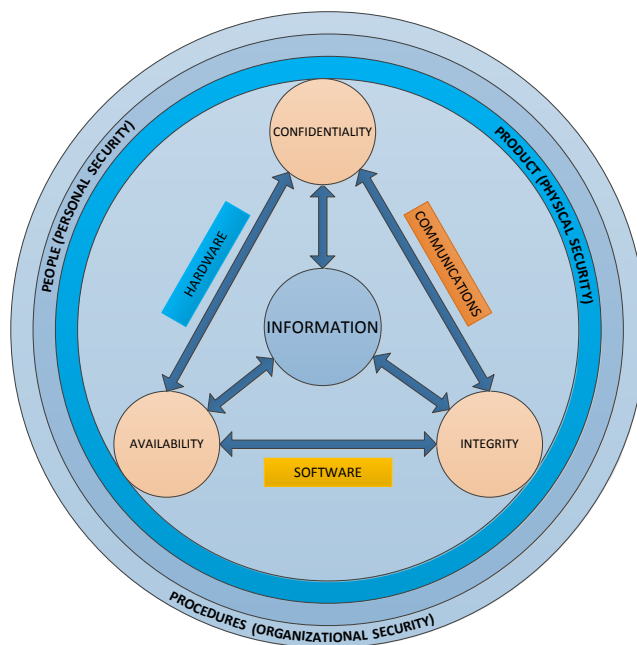

Broad experience with leading products providers of system and network security products, such as Cisco®, Juniper®, Checkpoint®, Symantec®, and McAfee® allow Ingenicomm to design flexible multi-layer defensive strategies that provide effective security while minimizing adverse impacts to ease of use and simplifying operational and maintenance processes and procedures.

Certification and Auditing

Ingenicomm conducts comprehensive testing to ensure that system security controls are implemented correctly, operate as expected, and produce the necessary artifacts. Ingenicomm's security analysts are experienced in preparing and conducting security verification and validation and system certification and accreditation activities. Ingenicomm's capabilities include providing internal and external assessments of control compliance, as well as dedicated system and network compliance auditing.

Secure Data Storage and Transfer

Ingenicomm has the expertise to provide recommendations regarding secure data access, storage, and sharing in both classified and unclassified environments. Ingenicomm's security analysts can prepare information exchange policies and procedures, as well as providing monitoring and auditing capabilities for compliance verification and incident resolution.

Key Services

- Vulnerability and security risk assessment and remediation/mitigation
- Security control implementation for NIST 800, FISMA, and CIS compliance
- Application and web service software security auditing and remediation
- Multi-layer network security boundary implementation
- Network and host intrusion detection and prevention
- Independent security control verification and validation, auditing, and certification and accreditation
- Security training and user awareness
- Multifactor authentication and PKI implementation
- Mission-critical data integrity assurance and verification

Ingenicomm, Inc. is a leading provider of ground and range equipment and enterprise engineering services for civil and commercial aerospace programs, as well as the defense and intelligence communities.
